

BUSCH **JET★STAR™**

ECONOCOOLER

JET★STAR™ portable coil coolers for high speed cooling of metal coils

The BUSCH **JET★STAR** portable coil cooler is used for high speed cooling of steel and aluminum coils. The **JET★STAR** cooler was engineered and designed to substantially shorten the cooling period (25% to 75%) typically required by traditional man cooling propeller fans. Being portable and relatively compact, users are able to both reduce cooling time and minimize the storage space required for coil cooling.

The **JET★STAR** unit is equipped with a patented, durable/flexible nozzle system. The nozzles have "memory" and will simply return to normal shape and position if bumped during use. Additionally, the system

allows for easy nozzle replacement should they become permanently damaged. The coolers can be arranged in any configuration desired to minimize coil cooling storage area. The jet tube design allows the coils to be a foot or more away from the cooler while maintaining peak cooling efficiency.

The **JET★STAR** portable cooler has been tested under field conditions and has proven itself to be more effective than the usual propeller fans in every case. In addition, the **JET★STAR** cooler operates well below OSHA guidelines for noise.
